

Jitsu QA – Probation Goals • v1.1

JITSU QA TEAM

Your Probation Goals

Junior QA *** Senior QA**

What you should achieve during your 2-month probation at Jitsu

📋 WHAT'S INSIDE

- ✓ Your probation timeline (Day 1 → Day 60)
- ✓ 5 goal areas for Junior QA
- ✓ 7 goal areas for Senior QA
- ✓ How you will be assessed
- ✓ Pass / Not Pass thresholds
- ✓ What happens at each outcome
- ✓ Tips to succeed during probation

Welcome to the Jitsu QA Team

Version 1.1 • May 26, 2026

Document Version History

This document is versioned. Whenever it's updated, the changelog below records what changed + when. Members can quickly see what's new without re-reading the entire doc.

Version	**Date**	**Changes**	
---	---	---	
v1.1	May 26, 2026	Added Feature Documentation skills to both levels (Category 3): Junior – Feature Documentation Hygiene + Feature Flag Documentation. Senior – Feature Documentation Ownership + Feature Flag Documentation Standards. Added "📖 Documentation discipline" section to Tips (Section 8) with concrete examples (claimsProcessingEnabled, SLA_VERSIONING_ENABLED, enable_require_id_scan).	
v1.0	May 26, 2026	Initial pilot release. Junior QA (5 goal areas, 33 skills) + Senior QA (7 goal areas, 41 skills). 2 outcomes (PASS / NOT PASS). Includes: Deep domain knowledge (Shipment + Assignment Lifecycle full flow, Cross-team Knowledge), AI fluency (4 skills per level – usage, prompt engineering, verification, workflow design), Business + Product mindset, Risk-based thinking (Senior), Daily progress reporting (non-negotiable Day 1).	

| **📌 Versioning convention** • **Minor updates** (e.g. v1.0 → v1.1) – wording tweaks, single skill adjustment, clarification. • **Major updates** (e.g. v1.x → v2.0) – adding/removing categories, changing thresholds, restructuring goal areas. If you have an older version, check this changelog to see what's new before discussing with your QA Lead. |

| --- |

5.	Evidence That Counts
6.	Pass / Not Pass Thresholds
7.	What Happens at Each Outcome
8.	Tips to Succeed During Probation

1. Welcome **&**** Your Probation Timeline**

Welcome to the Jitsu QA Team! This document outlines what you should achieve during your 2-month (60-day) probation period. Read it on Day 1 – it tells you exactly what "good" looks like at the end of probation, so you can set your own goals from the start.

Why this document exists

- You know upfront what's expected – no surprises at Day 60.
- You can self-assess your progress along the way and ask for help where needed.
- Your QA Lead uses the same criteria – fair and consistent evaluation.
- Helps you plan your learning + identify gaps early.

Your Probation Timeline

Milestone	**When**	**What happens**
---	---	---
Day 1	Your first day	Onboarding kickoff. Your QA Lead walks you through this document. You receive Welcome Kit + 2-Week Onboarding Plan. Start setting your own goals.
Day 14	End of week 2	Informal check-in with QA Lead. Review onboarding progress. Raise any blockers – don't wait until they pile up.
Day 30	Mid-probation	Formal 1:1 review. You self-assess + QA Lead assesses. Compare in 1:1. This is a chance to course-correct, not a final judgment.
Day 45	Pre-final check	Light check-in. Confirm you're on track. If gaps exist, agree on focus areas for final 2 weeks.
Day 60	Final evaluation	Final review. QA Lead determines outcome: Pass / Not Pass. Discussion with Engineering Lead before submitting to HR.

💡 Probation is a 2-way relationship While we're evaluating whether you're a good fit for Jitsu, you're also evaluating whether Jitsu is a good fit for you. Don't hesitate to raise questions about: the role, the team, what you need to succeed, what feels confusing. We'd rather you ask early than struggle silently.

📢 Daily progress reports – non-negotiable, starting Day 1 Post a brief daily update in the QA channel every working day. Format: what done today, what blockers, what's planned tomorrow. This is how your QA Lead stays informed without having to chase you – and how the team identifies issues early. If you hit an issue (technical blocker, ticket unclear, environment broken, anything affecting your work) – DON'T wait for daily standup or your next 1:1. Ping your Lead immediately. Early visibility = faster resolution. Missing daily reports or hiding blockers is the single most common reason a probation goes sideways. Don't make that mistake.

| --- |

2. Junior QA – Your 5 Goal Areas

As a Junior QA, here's what you should achieve by Day 60. You're expected to learn the Jitsu domain rapidly, follow the QA process, and contribute to sprint with appropriate scope tickets. Don't underestimate the domain – Jitsu's logistics + delivery flow has real depth, and you'll be expected to understand it deeply (not just superficially) by end of probation.

Weight distribution

#	**Category**	**Weight**	**Focus**
---	---	---	---
1	**Domain Knowledge**	20%	Deep understanding of Jitsu domain + cross-team
2	**Basic Technical Skills**	20%	E2E + Postman + DB + Datadog + Mobile + AI fluency (prompts, verification)
3	**QA Process**	25%	Test cases, QMetry, bug reporting, release process, doc hygiene
4	**Quality of Work**	20%	Completion + thoroughness + learning velocity
5	**Soft Skills ***** Attitude**	15%	Communication + business mindset + curiosity
	TOTAL	**100%**	

Category 1 – Domain Knowledge (20%)

Junior must build deep understanding of Jitsu's business and entities during probation. The domain is complex – but mastering it is essential for everything else.

Skill	**Description / Expectation**
---	---
Jitsu Business Model	Understands what Jitsu does (last-mile delivery) + 3 parties (Client / Driver / Recipient) and how they interact.
Client Service Types	Understands 4 client service types with enum codes (NEXT_DAYS=0 / ON_DEMAND=1 / SPECIALTY=2 / FCTD=3) and their delivery flows. Knows the difference between commingle and direct flows.
Driver Types (Deep)	Knows IC / DSP / 3P / Linehaul + their booking permission matrix (only IC can self-book; DSP/3P assigned directly). Understands edge cases: Linehaul auto-assignment, sprinkling. Doesn't confuse 'courier' (= DSP + 3P) with IC.
Warehouses *** Regions**	Knows 4 warehouse types + when each is used. Understands the region/zone hierarchy + the rule: 1 Region = 1 Client Type.
Shipment Lifecycle (Full Flow)	Understands full status flow: DRAFT/CREATED → GEOCODED → ASSIGNED → PICKUP_* → DROPOFF_* / RETURN_* / CANCELLED_*. Knows what each failure status means (PICKUP_FAILED, DROPOFF_FAILED, RESCHEDULED, RETURN_TO_CLIENT).
Assignment Lifecycle (Full Flow)	Understands assignment status flow + stop statuses (PENDING / EN_ROUTE / SUCCEEDED / FAILED). Knows sprinkling (adding shipment to existing assignment) + dispatcher rescue scenarios.
Cross-team Knowledge	Understands how WAT (Web App) / INB (Inbound/Warehouse) / Routing / MOB (Mobile) teams interact. Knows which team owns which feature.
Core Terminology	Comfortable with: Shipment / Route / Assignment / POD / OTD / SLA / Geofencing / Sprinkling.

Category 2 – Basic Technical Skills (20%)

Junior is expected to USE QA tooling, not master it. Help from buddy / doc is acceptable. Strong AI usage is a force multiplier – leverage it.

Skill	Description / Expectation
E2E Flow Execution	Can run E2E flow on Staging WITH GUIDANCE from buddy or doc. Doesn't need to do it alone yet.
Postman Basics	Can use QA Master Collection for simple requests. Refreshes tokens correctly.
Database – Read Only	Can connect via StrongDM + run basic SELECT queries from the Cheat Sheet.
Datadog – Find Logs	Can find logs in Datadog for a specific service when shown how. Understands what logs to look at.
Mobile App Testing	Tests Driver App across iOS + Android devices. Familiar with Firebase (Staging build distribution) + TestFlight (Prod build distribution) workflow.
AI Tools for Productivity	Uses AI tools (e.g. Claude, ChatGPT, Augment) for daily work – generating test ideas, drafting test cases, summarizing tickets, writing bug reports, explaining unfamiliar code.
Prompt Engineering (Basic)	Writes effective prompts: provides context (ticket info, code snippets, AC), specifies output format, breaks down complex tasks. Iterates on prompts when first output is poor – doesn't give up after one try.
AI Verification & Critical Thinking	Recognizes AI hallucinations (fake API names, wrong status codes, made-up function signatures). Always cross-checks AI output against actual codebase / docs / Confluence before acting on it. Treats AI as an assistant, not authority.
AI-assisted Domain Research	Uses AI to navigate Jitsu's complex domain efficiently – summarizing long Confluence pages, finding relevant tickets, understanding unfamiliar code areas. Combines AI with Confluence search to onboard faster.

Category 3 – QA Process (25%)

The highest-weight category. Junior must follow Jitsu's QA process – accuracy more important than speed.

Skill	Description / Expectation
Test Case Writing	Writes basic test cases using Jitsu template. Covers happy path. May miss edge cases – that's OK at this level.
QMetry Usage	Creates folder per ticket. Imports test cases. Follows naming convention.
Verification Comments	Posts comment per env (Staging / Beta / Prod) with status + evidence. May need reminders on build version.
Bug Reporting	Logs bugs per template (10 required fields). Mobile bugs include Fix Version. Evidence is clear.
Release Process Awareness	Understands isolated-release-branch concept at high level. Knows the rule to smoke test previous tickets on same repo.
Feature Documentation Hygiene	When working on a feature: searches Confluence for existing feature doc first. If exists → updates it to reflect new behavior. If not → asks Lead whether to write new (bonus if proactive). Doesn't let docs go stale.
Feature Flag Documentation	When a ticket introduces a new feature flag, writes a Confluence doc capturing: flag name, location (Consul / Firebase / item_metadata / etc.), default value, when to enable/disable, scope (region / client / global). References existing examples (e.g. `enable_require_id_scan`, `claimsProcessingEnabled`, `SLA_VERSIONING_ENABLED`).
Production Safety	Knows 8 Production Rules. Always asks supervisor before doing anything on Prod.

Category 4 – Quality of Work (20%)

Junior outputs measured by completion + thoroughness within their scope. Learning velocity matters.

Skill	Description / Expectation
-------	---------------------------

```
| --- | --- |
| **Ticket Completion** | Completes assigned tickets within sprint. Ticket scope adjusted to Junior level. |
| **Test Thoroughness** | Tests AC scenarios. Catches obvious bugs. May miss subtle ones – that's expected at Junior level. |
| **Evidence Quality** | Attaches screenshots / videos to verification comments. Evidence is visible and clear. |
| **Learning Velocity** | Picks up new concepts week by week. Asks questions to learn faster. Demonstrates growth Day 1 → Day 60. |
```

****Category 5 – Soft Skills ****&**** Attitude (15%)****

For Junior, attitude and willingness to learn are CRITICAL. Skills can be taught – attitude is the foundation.

```
| **Skill** | **Description / Expectation** |
| --- | --- |
| **Daily Progress Reports to Lead** | Posts daily updates in QA channel so QA Lead always knows your status. Reports include: what done today, what blockers, what's planned tomorrow. NEVER skip – if no progress, still post and explain why. |
| **Proactive Issue Escalation** | If you hit an issue (technical blocker, ticket unclear, environment broken, personal issue affecting work) – report it to Lead IMMEDIATELY. Don't wait for daily standup or until it becomes critical. The earlier Lead knows, the easier to unblock you. |
| **Asking Questions** | Uses the 15-min rule – asks for help after 15 min stuck. Not afraid to ask 'dumb' questions. |
| **Receptive to Feedback** | Takes coaching well. Applies feedback in the next ticket without defensiveness. |
| **Team Engagement** | Engages in team rituals (standup, retro, training). Shows interest in learning beyond just assigned work. |
| **Business Mindset (not Outsource Mindset)** | Doesn't just "complete what's in the ticket and stop". Thinks about the business goal behind the ticket – why does it matter to the user / client? Goes beyond the literal scope when needed. |
| **Product Curiosity** | Curious about the Jitsu product as a whole – not just their assigned area. Explores other features, asks about how things work, raises questions that show genuine interest. |
| **Raises Risks Proactively** | If they spot a potential risk or issue (even outside their ticket), they raise it. Not limited to "my ticket only" thinking. |
```

****3. Senior QA – Your 7 Goal Areas****

As a Senior QA, here's what you should achieve by Day 60. You're expected to handle complex tickets independently, mentor others, drive process improvements, and contribute strategically to quality at Jitsu.

****Weight distribution****

```
| **#** | **Category** | **Weight** | **Focus** |
| --- | --- | --- | --- |
| **1** | **Domain Knowledge** | 15% | Deep business + cross-team knowledge |
| **2** | **Technical Skills** | 15% | Advanced tooling + API + strategic AI usage + lead AI adoption |
| **3** | **QA Process** | 20% | Test strategy + process mastery + doc ownership |
| **4** | **Quality of Work** | 15% | High completion rate + low escape rate |
| **5** | **Independence ****&**** Risk-based Thinking** | 15% | Risk-based test approach + ownership |
| **6** | **Mentoring, Knowledge Sharing ****&**** Communication** | 10% | Daily reporting + junior support + documentation |
| **7** | **Strategic Thinking ****&**** Business Mindset** | 10% | Impact analysis + business mindset + product curiosity |
```

| | ****TOTAL**** | ****100%**** | |

****Category 1 – Domain Knowledge (15%)****

Senior is expected to have deep domain knowledge AND guide juniors through it.

Skill	**Description / Expectation**
---	---
Jitsu Business Model	Can explain to a non-engineer in 2 minutes. Knows current business priorities. Can mentor juniors on domain basics.
Client Service Types	Deep understanding of 4 types (NEXT_DAYS=0 / ON_DEMAND=1 / SPECIALTY=2 / FCTD=3) + flows + Brand hierarchy (Parent / Brand / Brand-with-client_id).
Driver Types (Deep)	Knows IC / DSP / 3P / Linehaul + full booking permission matrix. Understands all edge cases (Linehaul auto-assignment, sprinkling logic, 3P escalation conditions).
Warehouses **&**** Regions**	Understands all 4 warehouse types + when each is used. Knows regional differences and operational nuances.
Shipment Lifecycle (Full Flow)	Knows full status flow: DRAFT/CREATED → GEOCODED → ASSIGNED → PICKUP_* → DROPOFF_* / RETURN_* / CANCELLED_*. Understands edge cases: PICKUP_FAILED recovery, RESCHEDULED, RETURN_TO_CLIENT flow, virtual statuses.
Assignment Lifecycle (Full Flow)	Knows assignment status flow + stop statuses (PENDING / EN_ROUTE / SUCCEEDED / FAILED). Understands sprinkling + dispatcher rescue + abnormal route scenarios.
Cross-team Knowledge	Understands how WAT / INB / Routing / MOB teams interact. Knows handoffs + cross-team dependencies. Knows when to escalate to which team.

****Category 2 – Technical Skills (15%)****

Senior must demonstrate advanced fluency in QA tooling AND lead the team on effective AI usage.

Skill	**Description / Expectation**
---	---
E2E Flow Mastery	Runs full E2E in < 1 hour. Can guide a Junior through it without notes.
Postman Advanced	Writes pre-request scripts. Chains requests across multiple endpoints.
Database Mastery	Comfortable querying both PostgreSQL + MongoDB. Writes JOINS + aggregations.
API Understanding	Understands API contracts. Reviews API specs for testability concerns.
Mobile App Testing	Tests Driver App across iOS + Android devices. Familiar with Firebase (Staging build distribution) + TestFlight (Prod build distribution) workflow. Can guide juniors through mobile testing process.
AI Tools (Strategic Use)	Uses AI (Claude, ChatGPT, Augment, Claude Code, DevOps GPT) strategically to boost productivity AND quality – generating comprehensive test cases, analyzing code changes for regression risk, reviewing test coverage, drafting clear bug reports, accelerating documentation. Picks the right AI tool for the right job.
Prompt Engineering (Advanced)	Writes precise, structured prompts that consistently get useful output the first try. Knows when to give AI more context vs less, how to break complex tasks into steps, how to constrain output format. Shares effective prompts + workflows with juniors.
AI Verification **&**** Hallucination Detection**	Spots AI hallucinations fast (fake APIs, wrong domain logic, made-up Jitsu terminology). Always verifies against codebase / Confluence – especially for business-critical decisions. Trains juniors to do the same.
AI-assisted Workflow Design	Designs efficient AI-assisted workflows for the team – which tasks to AI-assist, how to chain AI tools (e.g. Augment for code context + Claude for test strategy + DevOps GPT for SDLC). Stays current on new AI capabilities relevant to QA.

Category 3 – QA Process (20%)

Senior is expected to demonstrate mastery of QA process and define test approach.

Skill	**Description / Expectation**
---	---
Test Strategy	Defines test approach per ticket. Identifies risks early. Adjusts test scope based on impact.
Test Case Quality	Test cases cover happy + edge + negative + integration scenarios systematically.
QMetry *** Documentation**	Maintains QMetry structure clean. Contributes to test case library for re-use.
Bug Reporting Excellence	Bug reports clear, reproducible, with strong evidence. Includes impact analysis.
Verification Discipline	Comments on Jira after EACH env. Includes build version + scope + evidence consistently.
Release Process Mastery	Handles hotfix + partial release flows correctly. Knows when to skip Beta (e.g. no worker on Beta).
Feature Documentation Ownership	Owns feature documentation discipline. For every feature shipped: ensures Confluence doc exists + is up to date. Writes new docs when none exist. Trains juniors to do the same. Treats stale docs as a quality issue, not just a nice-to-have.
Feature Flag Documentation Standards	Writes high-quality Confluence docs for every new feature flag: name, location (Consul / Firebase / item_metadata), default value, enable/disable conditions, scope (region / client / global), rollback plan, expected behavior when flag flips. Reviews juniors' flag docs.
Production Safety	Follows 8 Production Rules religiously. Trains junior on Prod safety.

Category 4 – Quality of Work (15%)

Senior is expected to handle complex tickets with high accuracy.

Skill	**Description / Expectation**
---	---
Ticket Completion Rate	Completes ≥ 90% assigned tickets on-time. Handles complex / multi-system tickets.
Defect Escape Rate	Bugs found AFTER QA verified < 10%. Solid coverage on Senior-level tickets.
Test Coverage Depth	Covers happy + edge + negative + performance considerations on complex tickets.
Bug Triage	Logs bugs with correct priority. Distinguishes regressions vs new issues correctly.

Category 5 – Independence *** Risk-based Thinking (15%)**

Senior QA must think in terms of risk + impact, not just tickets. Operates as a self-directed contributor.

Skill	**Description / Expectation**
---	---
Risk-based Test Approach	Identifies HIGH / MEDIUM / LOW risk areas per ticket and allocates test effort accordingly. Doesn't test everything equally – focuses where impact is highest.
Risk Identification	Proactively flags risks to PM / PO BEFORE they become production bugs. Catches risks in planning / refinement, not after deploy.
Process Improvement	Suggests improvements to QA process. Implements when approved.
Decision Making	Makes judgment calls on test scope and priority. Can justify decisions to Engineering Lead with risk reasoning.

Category 6 – Mentoring, Knowledge Sharing **&**** Communication (10%)**

Senior is expected to lift the team and maintain transparency – not just deliver own tickets.

Skill	**Description / Expectation**
---	---
Daily Progress Reports	Posts daily updates in QA channel – even though no one asks. Lead always knows where Senior's work stands without having to chase. Senior models the reporting culture for juniors.
Proactive Issue Escalation	When hitting an issue (blocker, risk, environment problem, ticket scope confusion), raises to Lead immediately – not at next 1:1. Includes proposed solutions, not just problems.
Junior Support	Helps junior QA when asked. Patient. Explains the 'why' behind decisions.
Documentation Contribution	Writes / updates internal docs. Captures team knowledge.
Knowledge Sharing Sessions	Presents learnings, demos new tools, shares tips in team meetings.

Category 7 – Strategic Thinking **&**** Business Mindset (10%)**

Senior contributes to quality decisions beyond just executing tests, with strong business + product awareness.

Skill	**Description / Expectation**
---	---
Impact Analysis	Understands how a ticket impacts other features. Plans regression accordingly.
Cross-team Communication	Communicates effectively with Dev / PO / Eng Leads. Pushes back constructively when needed.
Quality Advocacy	Pushes for quality at planning / refinement stages – not just at QA stage.
Business Mindset (not Outsource Mindset)	Doesn't just complete what's in the ticket. Thinks about the business goal – why does this feature matter to the client / driver / recipient? Suggests changes when ticket scope doesn't match business goal.
Product Curiosity	Genuinely curious about the Jitsu product as a whole – not just their assigned area. Explores how features interact, asks 'why' often. Brings outside knowledge / industry awareness into discussions.

4. Scoring Methodology

Each skill within a category is scored on a 1-5 scale. The scores are averaged within the category, then weighted by category weight to compute the overall score.

📏 Scoring Scale (1-5)

Score	**Label**	**Description**
---	---	---
5	**Excellent**	Consistently exceeds expectations. Could mentor others on this skill.
4	**Strong**	Meets expectations consistently. Reliable in this area.
3	**Acceptable**	Meets minimum expectations. Some inconsistency.
2	**Needs Improvement**	Below expectations. Requires coaching.
1	**Unacceptable**	Significant gap. Cannot perform this skill independently.

How the overall score is calculated

- Each skill gets scored 1-5 based on observed behavior + concrete evidence.
- Category average score = mean of all skills in that category.

- Weighted % = (category_avg / 5) × category_weight.

- Overall % = sum of all weighted % (out of 100).

|  Score consistently, not generously** Default to score 3 (Acceptable) unless you have evidence to score higher or lower. Score 5 should be rare – it means truly exceptional. Score 1 is a serious concern. Most skills should land at 3 or 4 for a passing candidate. |

| --- |

5. Evidence That Counts

Your evaluation isn't based on impressions – it's based on concrete evidence. Knowing what counts helps you focus on the right things during probation.

What evaluators look at

| **Source** | **What it tells the evaluator** |

| --- | --- |

| **Your Self-assessment** | Your own view of your performance. Be honest – under-rating yourself is as unhelpful as over-rating. Submit it before each formal review. |

| **QA Lead's Observation** | Direct observation by your QA Lead throughout probation. They watch how you work, communicate, and grow. |

| **Cross-team Feedback** | Feedback from Devs, POs, PMs you worked with. Communication + collaboration are visible to them. |

| **Your Concrete Output** | Your actual tickets in Jira, test cases in QMetry, bug reports, verification comments, Slack reports. These are the artifacts that prove your skills. |

**What concrete metrics matter

- # of tickets you completed during probation.

- # of bugs you logged + their quality (clear repro steps, evidence).

- # of test cases you wrote in QMetry.

- # of bugs that escaped to Production after you verified – this is a key quality metric.

- # of doc contributions or updates.

- Quality of your verification comments – is evidence always attached?

- Daily Slack reports consistency – did you post every working day?

- Specific incidents – positive (caught a critical bug) or negative (missed a regression).

|  Build your own evidence file as you go** Don't wait until Day 60 to recall what you did. Keep a personal log: • "Ticket WAT-2017 – wrote 8 test cases, found 2 bugs pre-deploy" • "Bug MOB-2745 – well-reproduced, correct Fix Version set" • "Suggested improvement in retro – adopted by team" This helps you self-assess accurately AND gives concrete examples to discuss in 1:1s with your QA Lead. |

| --- |

6. Pass / Not Pass Thresholds

After all scores are calculated, the overall % score determines whether you've passed probation.

Junior QA Thresholds

Junior bar is more forgiving – they're learning. Focus on growth trajectory + attitude.

Outcome	**Condition**
---	---
✅ PASS – confirm role	Overall $\geq 65\%$ AND every category $\geq 45\%$
❌ NOT PASS – not a fit	Overall $< 65\%$ OR any category $< 45\%$

Senior QA Thresholds

Senior bar is higher – they're expected to operate at a more advanced level.

Outcome	**Condition**
---	---
✅ PASS – confirm role	Overall $\geq 80\%$ AND every category $\geq 60\%$
❌ NOT PASS – not a fit	Overall $< 80\%$ OR any category $< 60\%$

💡 Score $\neq$ final decision The scoring framework gives a data-driven view. Final decision involves QA Lead + Engineering Lead + HR – numbers alone don't capture everything. Borderline cases (just above/below threshold) are discussed carefully before the decision is final.

7. What Happens at Each Outcome

At Day 60, the evaluation determines whether you're a good fit for Jitsu. There are 2 possible outcomes:

✅ PASS – Welcome to Jitsu officially!

Most QA hires pass probation. If you do:

- HR confirms your role officially.
- Celebrate with the team – you've earned it.
- You + QA Lead discuss next 3-month growth focus: which skills to deepen, what new areas to explore.
- Regular sprint assignment going forward.

❌ NOT PASS

In some cases, the role isn't the right fit. If this happens:

- Your QA Lead explains the decision clearly with specific evidence from your work.
- Exit interview – you share your feedback so Jitsu improves the onboarding + hiring process.
- HR handles the official exit paperwork (notice period, last working day, etc.).
- Knowledge handoff for any in-progress tickets.

💡 If you feel uncertain about your trajectory Don't wait until Day 60 to find out. Ask your QA Lead during Day 14 / Day 30 / Day 45 check-ins: • "Am I on track?" • "Which goal area should I focus on more?" • "Is there anything I'm missing that I should know about?" Early conversations almost always lead to better outcomes than late ones. The Day 30 review is a chance to course-correct – use it.

| --- |

8. Tips to Succeed During Probation

Practical advice from QA Leads who've onboarded many QAs at Jitsu:

🎯 In Week 1-2

- Read the ****Welcome Kit**** + ****2-Week Onboarding Plan**** carefully – they're your roadmap.
- Set up all tooling on Day 1-2 (StrongDM, Postman, QMetry, Datadog access).
- Don't be afraid to ask 'dumb' questions – better to ask than guess.
- Post daily progress reports in QA channel from Day 1 – it's a habit, not a punishment. Lead needs visibility.
- If you hit ANY blocker, ping Lead immediately – don't wait for daily standup.

🎯 In Week 3-6

- Start picking up real tickets. It's OK if you're slow – focus on accuracy first.
- Use the 15-minute rule: if you're stuck > 15 min, ask your Buddy.
- After every ticket, review what went well + what you could improve.
- Apply feedback in the next ticket – show that you're learning.

🎯 In Week 7-8 (final stretch)

- Self-assess against the goals in Sections 2/3 – be honest with yourself.
- Bring questions to Day 45 check-in: what should you focus on?
- Demonstrate growth – your Day 60 self should be visibly stronger than Day 1.
- Stay curious. Probation passed doesn't mean stop learning – it means you're trusted to keep going.

📖 Documentation discipline

- ****When working on a feature**** – first search Confluence for existing feature doc. If found, update it as part of your ticket. If not, ask Lead if you should write one (it's almost always yes).
- ****When you spot a new feature flag**** – write a Confluence doc capturing: flag name, location (Consul / Firebase / item_metadata / etc.), default value, enable/disable conditions, scope (region/client/global). Check existing flag docs as templates.
- ****Stale docs = quality bugs in disguise.**** Outdated docs cause juniors to test wrong, devs to assume wrong behavior, and PMs to plan wrong features. Updating docs IS QA work.
- ****Examples of good flag docs****: `claimsProcessingEnabled`, `SLA\_VERSIONING\_ENABLED`, `enable\_require\_id\_scan`. Use these as templates when writing your own.

🤖 Using AI effectively

- ****Use AI daily for****: drafting test cases from AC, summarizing long Confluence

pages, explaining unfamiliar code areas, writing better bug repro steps, brainstorming edge cases.

- ****Always verify**** – AI can hallucinate Jitsu-specific terminology (fake driver types, wrong statuses, made-up API names). Cross-check against Confluence / code / asking team.

- ****Give AI context**** – paste the ticket, the AC, relevant code, the Confluence page. AI without context = generic answers.

- ****Iterate**** – first prompt rarely perfect. Refine: "Make it more specific to Jitsu's NEXT_DAYS flow" / "Focus on edge cases only" / "Output as markdown table".

- ****Share your best prompts**** with the team – what works for you probably works for others.

| ****💡 The single best predictor of probation success**** It's not technical brilliance. It's attitude + consistency: • Show up daily, do the work, report your progress • Ask questions when stuck • Apply feedback in the next ticket • Be honest about your gaps • Leverage AI as your assistant – not as authority QAs with great attitude almost always pass – even if their technical skills started slow. |

| --- |

****Good luck – you've got this! 🎯****

Welcome to the Jitsu QA Team.

Page of
